Suitable salts of compounds of the formula 1 are – depending on the substitution – in particular all acid addition salts. Particular mention may be made of the pharmacologically acceptable salts of the inorganic and organic acids customarily used in pharmacy. Those suitable are water-soluble and water-insoluble acid addition salts with acids such as, for example, hydrochloric acid, hydrobromic acid, phosphoric acid, nitric acid, sulfuric acid, acetic acid, citric acid, D-gluconic acid, benzoic acid, 2-(4-hydroxybenzoyl)benzoic acid, butyric acid, sulfosalicylic acid, maleic acid, lauric acid, malic acid, fumaric acid, succinic acid, oxalic acid, tartaric acid, embonic acid, stearic acid, toluenesulfonic acid, methanesulfonic acid or 3-hydroxy-2-naphthoic acid, where the acids are employed in the salt preparation in an equimolar ratio or in a ratio differing therefrom, depending on whether the acid is a mono- or polybasic acid and on which salt is desired.

Pharmacologically unacceptable salts, which can be initially obtained, for example, as process products in the preparation of the compounds according to the invention on an industrial scale, are converted into pharmacologically acceptable salts by processes known to the person skilled in the art.

The compounds of the formula 1 according to the invention can be synthesized from the corresponding starting compounds, for example according to the reaction scheme 1 given below. The synthesis is carried out in a manner known to the expert, for example as described in more detail in the examples which follow the schemes.

Scheme 1:

Compounds of the formula 2 can be transformed directly to compounds of the formula 1, for example by electrophilic aromatic substitution. Examples to be mentioned are aminoalkylation or halogenation reactions for the synthesis of compounds of the formula 1 with, for example, R2 = mono- or di-1-4C-alkylaminomethyl or halogen.

Alternatively, compounds of the formula 2 can be first transformed, for example by a Vilsmeier formylation, to compounds of the formula 3, followed by further derivatization reactions, which are known to the expert (for example reduction of the carbonyl group, followed if desired by an etherification, or oxidation of the formyl functionality to a carboxylic acid, followed if desired by reaction with a suitable

- 49 -

amine and formation of an amide group $R_2 = -CO-NR_{21}R_{22}$, or addition of Grignard reagents, followed if desired by an oxidation of the secondary hydroxy group), which lead to compounds of the formula 1.

Another possible access to compounds of the formula 1 is, for example, offered by the transformation of compounds of the formula 4a, for example by C-C-bond forming reactions, like for example Heck-, Suzuki- or Sonogashira-coupling reactions, followed, if desired, by further derivatization reactions known to the expert, like for example reduction of unsaturated substituents R_2 to the corresponding 1-4C-alkyl chains. Compounds of the formula 4a can be prepared from compounds of the formula 2 for example by a halogenation reaction, for example a bromination reaction using a bromination reagent, like for example N-bromosuccinimide.

Compounds of the formula 1 can also be obtained by treatment of compounds of the formula 4b with an alkylation agent, e. g. methyl iodide, and subsequent nucleophilic substitution of the quaternary ammonium group, e. g. vs. cyanide. Compounds of the formula 4b can be prepared for example from compounds of the formula 2 by electrophilic substitution with Eschenmoser's salt.

Still another access to compounds of the formula 1 is, for example, offered by the transformation of compounds of the formula 2 to compounds of the formula 1 with $R_2 = NH_2$. This transformation can be achieved for example in analogy to the reactions described in J. Med. Chem., 1989, 32, 1686 or by nitration of compounds of the formula 2 and subsequent reduction of the nitro group. Further transformations by reactions known to the expert can then lead, if desired, to compounds of the formula 1 with $R_2 =$ mono- or di-1-4C-alkylamino, 1-4C-alkylcarbonylamino, 1-4C-alkoxycarbonylamino or 1-4C-alkoxy-1-4C-alkoxycarbonylamino. Alternatively, compounds of the formula 1 with $R_2 = NH_2$ can be transformed into the corresponding diazonium salts. Further compounds of the formula 1, for example where R_2 is e. g. hydroxy or 1-4C-alkoxy, can then be obtained by substitution of the diazonium group via reactions known to the expert.

Compounds of the formula 2 can be prepared, for example according to the reaction sequence outlined in scheme 2.

Scheme 2

Compounds of the formula 7 can be obtained for example from compounds of the formula 5 by an O-alkylation followed by a thermally induced Claisen-rearrangement reaction of the O-alkylation product of the formula 6. Protection of the alcohol functionality in compounds of the formula 7 with a suitable protection group Prot, for example a pivaloyl group, using standard conditions leads to compounds of the formula 8, which can be subjected in a next reaction step for example to a cross metathesis reaction, for example using a suitable Grubbs catalyst, suitable for the introduction of the Arom residue. The reaction products of the formula 9 can be deprotected and the ring closure can be performed using methods known to the expert, for example under acidic conditions, which leads to the desired compounds of the formula 2.

Compounds of the formula 5 can be prepared as outlined in an exemplary manner in scheme 3.

Scheme 3

The preparation of compounds of the formula 11 from compounds of the formula 10 is carried out in a manner known per se to the person skilled in the art, for example in analogy to the reactions described in an exemplary manner in the International Patent Application WO 03/014123. Hydrogenation of compounds of the formula 11 to compounds of the formula 5 is carried out in a manner known per se to the person skilled in the art, using standard reaction conditions, like for example hydrogen / Pd(0).

Alternatively, compounds of the formula 1 can be prepared in a stereoselective way following the reaction steps as outlined generally in scheme 4. Compounds of the formula 13 can be prepared by asymmetric reduction of compounds of the formula 12. Numerous methods to perform asymmetric reduction of prochiral ketones are known (see for example E. N. Jacobsen, A. Pfaltz, Y. Yamamoto, *Comprehensive Asymmetric Catalysis*, Vol. I-III, Springer, Berlin, 1999) which comprise *inter alia* catalytic hydrogenation, catalytic transfer hydrogenation, chiral reducing agents (e. g. chiral boranes), achiral reducing agents in the presence of a chiral auxiliary or a chiral catalyst, hydrosilylation (achiral silane in combination with a chiral catalyst), and enzymatic reduction. The asymmetric catalytic hydrogenation using chiral hydrogenation catalysts of the Noyori type ($\text{RuCl}_2[\text{PP}][\text{NN}]$) is the preferred method for the synthesis of enantiopure diols of the formula 13. In the generic formula $\text{RuCl}_2[\text{PP}][\text{NN}]$, PP is used as a general abbreviation for a chiral diphosphine ligand and NN is used as an abbreviation for a chiral diamine ligand. A detailed description of the method and specific examples of hydrogenation catalysts can be found for example in *Angew. Chem.* 2001, 113, 40-75 and in the literature cited therein. Transformation of derivatives of the formula 13 into enantiopure 7H-8,9-dihydro-pyrano[2,3-c]-imidazo[1,2-a]pyridines of the formula 1-a can be accomplished by methods which proceed under $\text{S}_{\text{N}}2$ conditions. For this purpose, the hydroxyl group in alpha-position to the Arom radical can be transformed into a suitable leaving group LG, e. g. by esterification with acid halides or sulfonyl chlorides. For the prepara-

tion of compounds of the formula 14a, the phenolic hydroxy group can be temporarily protected. Suitable protecting groups are described for example in T. W. Greene, P. G. M. Wuts "Protective Groups in Organic Synthesis" 3rd edition, J. Wiley & Sons, New York, 1999. Alternatively, the phenolic hydroxyl group in compounds of the formula 13 can be transformed into a suitable leaving group LG using for example the reagents mentioned above leading to compounds of the formula 14b. A related procedure is disclosed in the International Patent Application WO 95/27714. Enantiopure compounds of the formula 1-a can be obtained, e. g. by heating of solutions of these intermediates 14a or 14b in dipolar aprotic solvents, like DMF or DMSO. The cyclization of compounds of the formula 14b can be carried out for example in the presence of a base, like e. g. sodium hydride. More conveniently, cyclization of the diols of the formula 13 can be accomplished under Mitsunobu conditions, e. g. using diisopropyl azodicarboxylate and triphenylphosphine.

Scheme 4

Compounds of the formula 12 are known for example from WO 03/014123, or they can be prepared in a known manner, analogously to known compounds. The purity of the compounds of the formula 12 has a major impact on the reaction conditions and the outcome of the asymmetric catalytic hydrogenation to compounds of the formula 13. In contrast to WO 03/014123 a further purification step is required, for example a crystallization step in the presence of a suitable organic acid. A convenient method to transform compounds of the formula 12 into other compounds of the formula 12 bearing a different substituent R³ is shown in scheme 5 and might be illustrated by the following examples: Esters of 7-(3-aryl-3-oxo-propyl)-8-hydroxy-imidazo[1,2-a]pyridine-6-carboxylates of the formula 15, wherein R³³ is for example a 1-4C-alkyl radical, can be transformed into acetals of the formula 16, for example by reaction with 2,2-dimethoxypropane in the presence of acids. Cleavage of the ester function, e. g. by saponification with sodium hydroxide, furnishes the corresponding carboxylic acids of the formula 17, which are then treated with a suitable coupling reagent, e. g. TBTU, followed by addition of the coupling partner, e. g. an amine, yielding derivatives of the formula 18. Alternatively, esters of the formula 16 can be reduced to the corresponding primary alcohol, e. g. using lithium aluminium hydride,

and the hydroxyl group can be activated for example by conversion into a halide or a sulfonate using e. g. thionyl chloride or methanesulfonyl chloride. Interconversion of the substituent R3 can then be accomplished by nucleophilic displacement reactions using nucleophiles like e. g. alkoxides. Finally, ketones of the formula 12 are obtained by cleavage of acetals of the formula 18, e. g. in the presence of acids like hydrochloric acid.

Scheme 5:

Another method suitable for asymmetric synthesis of compounds of the formula 1-a is depicted in Scheme 6. Compounds of the formula 19, which are obtained from compounds of the formula 9 by deprotection methods known to the person skilled in the art, can be transformed into chiral diols of the formula 13, for example by hydroboration of the double bond. Chiral reagents, which are suitable for this transformation, are discussed for example in *Aldrichimica Acta* 1987, 20(1), 9-24. An example that might be mentioned is isopinocampheylborane. Alternatively, achiral hydroboration reagents can be used in combination with a chiral catalyst. The transformation of chiral diols of the formula 13 into compounds of the formula 1-a was described above.

Scheme 6:

- 54 -

Likewise, the optical antipodes of the formula 1-b can be prepared in a stereoselective manner employing the methods, which are described above and illustrated in the schemes above. For this purpose, the transformations have to be conducted using the corresponding enantiomer of the chiral catalyst / chiral reagent, respectively.

Another way to prepare compounds of the formula 1 is to reduce ketones of the formula 12, using e. g. sodium borohydride, followed by cyclization of the obtained diols, which might be accomplished by acid catalysis or under Mitsunobu conditions (see e. g. WO 03/014123).

The derivatization, if any, of the compounds of the formula 1 and of compounds obtained according to the above Schemes 1 to 6 (e.g. conversion of a group R3 into another group R3 or conversion of a group R2 into another group R2) is likewise carried out in a manner known to the expert. For example, if compounds where R2 and/or R3 = -CO-1-4C-alkoxy, or where R3 = -CO-NR31R32 are desired, an appropriate derivatization can be performed in a manner known to the expert (e. g. metal catalysed carbonylation of the corresponding halo compound or conversion of an ester into an amide), for example at the stage of an intermediate compound or more conveniently at a later point in time, for example conversion of a compound of the formula 1 into another compound of the formula 1.

Specific examples of such transformations are shown in scheme 7 and comprise e. g. condensation reactions between carboxylic acids of the formula 20 and N-nucleophiles, which might be mediated e. g. by TBTU (O-benzotriazol-1-yl-N,N,N',N'-tetramethyluronium tetrafluoroborate) or CDI (N,N'-carbonyldiimidazole). Specific examples for N-nucleophiles are amines, sulfoneamines, hydroxylamines, and hydrazines. The compounds of the formula 21 are specific representatives of compounds of the formula 1 and/or are valuable intermediates for the preparation of such derivatives. Examples for further transformations of compounds of the formula 21 are the exchange of oxygen vs. sulfur or the N-OH group, e. g. using Lawesson's reagent or hydroxylamines, and elimination reactions, e. g. affording compounds where R3 is a nitrile group or a heterocyclic residue, e. g. a dihydrooxazole or a oxadiazole residue. Nitriles of the formula 22 can be converted into derivatives of the formula 1, where R3 is a

- 55 -

heterocyclic group, e. g. a dihydrooxazole, dihydroimidazole, or tetrazole group. Compounds of the formula 23, where the R³ substituent is a bromo atom, can also be considered as valuable intermediates for the synthesis of compounds of the formula 1 bearing different residues R³. A variety of different substituents are accessible, e. g. by Palladium-catalyzed cross-coupling reactions using e. g. boronic acids, organotin derivatives, metal nitriles, alkenes, alkynes, and combinations of carbon monoxide with amines/alcohols. If desired, the obtained compounds of the formula 1 can be transformed further by methods known to the person skilled in art. Specific examples of suitable transformations are described in the examples which follow without being limited to those.

Commercial utility

The compounds of the formula 1 and their salts have valuable pharmacological properties which make them commercially utilizable. In particular, they exhibit marked inhibition of gastric acid secretion and an excellent gastric and intestinal protective action in warm-blooded animals, in particular humans. In this connection, the compounds according to the invention are distinguished by a high selectivity of action, an advantageous duration of action, a particularly good enteral activity, the absence of significant side effects and a large therapeutic range.

"Gastric and intestinal protection" in this connection is understood as meaning the prevention and treatment of gastrointestinal diseases, in particular of gastrointestinal inflammatory diseases and lesions (such as, for example, gastric ulcer, peptic ulcer, including peptic ulcer bleeding, duodenal ulcer, gastritis, hyperacidic or medicament-related functional dyspepsia), which can be caused, for example, by microorganisms (e.g. *Helicobacter pylori*), bacterial toxins, medicaments (e.g. certain antiinflammatories and antirheumatics, such as NSAIDs and COX-inhibitors), chemicals (e.g. ethanol), gastric acid or stress situations. "Gastric and intestinal protection" is understood to include, according to general knowledge, gastroesophageal reflux disease (GERD), the symptoms of which include, but are not limited to, heartburn and/or acid regurgitation.

In their excellent properties, the compounds according to the invention surprisingly prove to be clearly superior to the compounds known from the prior art in various models in which the antiulcerogenic and the antisecretory properties are determined. On account of these properties, the compounds of the formula 1 and their pharmacologically acceptable salts are outstandingly suitable for use in human and veterinary medicine, where they are used, in particular, for the treatment and/or prophylaxis of disorders of the stomach and/or intestine

A further subject of the invention are therefore the compounds according to the invention for use in the treatment and/or prophylaxis of the abovementioned diseases.

The invention likewise includes the use of the compounds according to the invention for the production of medicaments which are employed for the treatment and/or prophylaxis of the abovementioned diseases.

The invention furthermore includes the use of the compounds according to the invention for the treatment and/or prophylaxis of the abovementioned diseases.

A further subject of the invention are medicaments which comprise one or more compounds of the formula 1 and/or their pharmacologically acceptable salts.

- 84 -

The medicaments are prepared by processes which are known per se and familiar to the person skilled in the art. As medicaments, the pharmacologically active compounds according to the invention (= active compounds) are either employed as such, or preferably in combination with suitable pharmaceutical auxiliaries or excipients in the form of tablets, coated tablets, capsules, suppositories, patches (e.g. as TTS), emulsions, suspensions or solutions, the active compound content advantageously being between 0.1 and 95% and it being possible to obtain a pharmaceutical administration form exactly adapted to the active compound and/or to the desired onset and/or duration of action (e.g. a sustained-release form or an enteric form) by means of the appropriate selection of the auxiliaries and excipients.

The auxiliaries and excipients which are suitable for the desired pharmaceutical formulations are known to the person skilled in the art on the basis of his/her expert knowledge. In addition to solvents, gel-forming agents, suppository bases, tablet auxiliaries and other active compound excipients, it is possible to use, for example, antioxidants, dispersants, emulsifiers, antifoams, flavor corrigents, preservatives, solubilizers, colorants or, in particular, permeation promoters and complexing agents (e.g. cyclodextrins).

The active compounds can be administered orally, parenterally or percutaneously.

In general, it has proven advantageous in human medicine to administer the active compound(s) in the case of oral administration in a daily dose of approximately 0.01 to approximately 20, preferably 0.05 to 5, in particular 0.1 to 1.5, mg/kg of body weight, if appropriate in the form of several, preferably 1 to 4, individual doses to achieve the desired result. In the case of a parenteral treatment, similar or (in particular in the case of the intravenous administration of the active compounds), as a rule, lower doses can be used. The establishment of the optimal dose and manner of administration of the active compounds necessary in each case can easily be carried out by any person skilled in the art on the basis of his/her expert knowledge.

If the compounds according to the invention and/or their salts are to be used for the treatment of the abovementioned diseases, the pharmaceutical preparations can also contain one or more pharmacologically active constituents of other groups of medicaments, for example: tranquillizers (for example from the group of the benzodiazepines, for example diazepam), spasmolytics (for example, bietamiverine or camylofine), anticholinergics (for example, oxyphencyclimine or phencarbamide), local anesthetics, (for example, tetracaine or procaine), and, if appropriate, also enzymes, vitamins or amino acids.

To be emphasized in this connection is in particular the combination of the compounds according to the invention with pharmaceuticals which inhibit acid secretion, such as, for example, H₂ blockers (e.g. cimetidine, ranitidine), H⁺/K⁺ ATPase inhibitors (e.g. omeprazole, pantoprazole), or further with so-called peripheral anticholinergics (e.g. pirenzepine, telenzepine) and with gastrin antagonists with the aim of increasing the principal action in an additive or super-additive sense and/or of eliminating or of decreasing the side effects, or further the combination with antibacterially active substances (such as,

- 85 -

for example, cephalosporins, tetracyclines, penicillins, macrolides, nitroimidazoles or alternatively bismuth salts) for the control of *Helicobacter pylori*. Suitable antibacterial co-components which may be mentioned are, for example, mezlocillin, ampicillin, amoxicillin, cefalothin, cefoxitin, cefotaxime, imipenem, gentamycin, amikacin, erythromycin, ciprofloxacin, metronidazole, clarithromycin, azithromycin and combinations thereof (for example clarithromycin + metronidazole).

In view of their excellent gastric and intestinal protection action, the compounds of formula 1 are suited for a free or fixed combination with those medicaments (e.g. certain antiinflammatories and antirheumatics, such as NSAIDs), which are known to have a certain ulcerogenic potency. In addition, the compounds of formula 1 are suited for a free or fixed combination with motility-modifying drugs.

Pharmacology

The excellent gastric protective action and the gastric acid secretion-inhibiting action of the compounds according to the invention can be demonstrated in investigations on animal experimental models. The compounds of the formula 1 according to the invention investigated in the model mentioned below have been provided with numbers which correspond to the numbers of these compounds in the examples.

Methodology

The abdomen of anesthetized rats (CD rat, female, 200-250 g; 1.5 g/kg i.m. urethane) was opened after tracheotomy by a median upper abdominal incision and a PVC catheter was fixed transorally in the esophagus and another via the pylorus such that the ends of the tubes just projected into the gastric lumen. The catheter leading from the pylorus led outward into the right abdominal wall through a side opening.

After thorough rinsing (about 50-100 ml), warm (37°C) physiological NaCl solution was continuously passed through the stomach (0.5 ml/min, pH 6.8-6.9; Braun-Unita I). The pH (pH meter 632, glass electrode EA 147; $\phi = 5$ mm, Metrohm) and, by titration with a freshly prepared 0.01N NaOH solution to pH 7 (Dosimat 665 Metrohm), the secreted HCl were determined in the effluent in each case collected at an interval of 15 minutes.

The gastric secretion was stimulated by continuous infusion of 1 $\mu\text{g/kg}$ (= 1.65 ml/h) of i.v. pentagastrin (left femoral vein) about 30 min after the end of the operation (i.e. after determination of 2 preliminary fractions). The substances to be tested were administered intraduodenally in a 2.5 ml/kg liquid volume 60 min after the start of the continuous pentagastrin infusion. The body temperature of the animals was kept at a constant 37.8-38°C by infrared irradiation and heat pads (automatic, stepless control by means of a rectal temperature sensor).

Box II Observations where certain claims were found unsearchable (Continuation of item 2 of first sheet)

This International Search Report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. ☒ Claims Nos.:
because they relate to subject matter not required to be searched by this Authority, namely:
Although claim 21 is directed to a method of treatment of the human/animal body (Article 52(4) EPC), the search has been carried out and based on the alleged effects of the compound/composition.
2. ☐ Claims Nos.:
because they relate to parts of the International Application that do not comply with the prescribed requirements to such an extent that no meaningful International Search can be carried out, specifically:
3. ☐ Claims Nos.:
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

Box III Observations where unity of invention is lacking (Continuation of item 3 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

see additional sheet

1. ☐ As all required additional search fees were timely paid by the applicant, this International Search Report covers all searchable claims.
2. ☐ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
3. ☐ As only some of the required additional search fees were timely paid by the applicant, this International Search Report covers only those claims for which fees were paid, specifically claims Nos.:
4. ☒ No required additional search fees were timely paid by the applicant. Consequently, this International Search Report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:
1-8 (all partly), 10 (partly), 11 (partly), 14 (partly), 20 (partly)
21 (partly)

Remark on Protest

- ☐ The additional search fees were accompanied by the applicant's protest.
- ☐ No protest accompanied the payment of additional search fees.
